Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Biol. 15.643.646(1990).
-!- FUNCTION: Anther-specific cell wall protein which could contribute
    to the cell wall architecture of epidermal anther cells via
    intermolecular disulfide bridges.
-!- TISSUE SPECIFICITY: Epidermal anther cells.
-!- DEVELOPMENTAL STAGE: Late developmental stages.
-!- SIMILARITY: Belongs to the plant defensin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SEQUENCE FROM N.A.

A. new family of basic cysteine-rich plant antifungal proteins from

Brassicaceae species.",

FEBS Lett. 316:233-240(1993).

-: FEMS Lett. 316:233-240(1993).

-: FEMS Lett. 316:233-240(1993).

-: FEMS Lett. 316:233-240(1993).

-: SUNOTION: Possesses some antifungal activity against B.megaterium.

-: SUBUNIT: Forms oligomers in its native state.

-: SUMILARITY: Belongs to the plant defensin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta, Spermatophyta, Magnoliophyta, eudicotyledons, core eudicots, rosids, eurosids II; Brassicales, Brassicaceae, Brassica.

Terras FRG; Rees SB, Broekaert WF, Cammue BPA, Osborn RW, Vanderleyden J;

WPI; 1993-100978/12.

Biocidal proteins isolated from seeds of plants - e.g. brassica or dahlia, useful for increasing plants' resistance to fungal and bacterial diseases.

Example 21; Fig 35; 110pp; English.

This cDNA represents the sequence of Rs-AFP1 from Raphanus sativus. primer AAQ38640 was used together with AAQ38641 to generate a probe

```
screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and digoxigenin-11-dUTP instead of dTTP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII cDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage then into the pBluescript phagemid form with the aid of helper phage then incompared by agarose gel electrophoresis. Four clones had insert sizes of approx. 400bp the others between 250-300bp. The inserts of the 4 largest clones were then sequenced and found to differ only in the length of their S' and 3' UTK's. The longest sequence is given here.
```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         301 ACAAAATAAGTCAGTGTCACTATCCATGAGTGATTTTAAGACATGTACCAGATATGTTAT 360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             301 ACAAATAAGTCAGTGTCACTATCCATGAGTGTTTTAAGACATGTACCAGATATGTTAT 360
                                                                                                                                                                                                                                                                                                                        Plant-derived antimicrobial proteins are expressed in endosymbiotic Clavibacter xyli subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFP1 from R. sativus. The full-length cDNA sequence of Rs-AFP1 is given in AAQ70128. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                Antimicrobial protein producing endo-symbiotic microorganisms - is produced by combining nucleic acids encoding the protein with an endophyte, useful for protecting plant hosts from esp. fungal disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CCAAGTGGGACATGGTCAGGAGTCTGTGGAAACAATAACGCATGCAAGAATCAGTGCATT

Raphanus sativus antifungal protein I (Rs-AFP1) cDNA AAT72333 standard; cDNA; 414 BP (first entry) (revised) 25-MAR-2003 19-JAN-1998 AAT72333; RESULT 3 AAT72333

Antifungal protein; candida; fungal resistance; food additive; radish; crop protection; plant defensin; bacterial protection; preservative; ss.

Raphanus sativus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This cDNA clone codes for the preprotein for radish antifungal protein I (Rs-AFP1) (AAM19617). Novel antifungal proteins are based on Rs-AFP1, Rs-AFP2 (see AAM19616), Rs-AFP3 and Rs-AFP4, especially those in which Gly9 is repaced by Arg, Val3b by Arg, Gly9 by Arg, Glu5 by Met and/or Gly16 by Met. Mutants (see AAW26377-90) of Rs- AFP2 are specifically claimed. The mutants show improved salt tolerant antifungal activity, particularly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This cDNA sequence encodes an Rhapanus sativus (radish) antifungal protein (Rs-AFP1). Analogues of the homologous protein, Rs-AFP2 (AAM19281), have also been produced (see AAM19282-92, AAM1928-98, AAM19310-04, AAM19310-34 and AAM31765-8314). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease tolerance of crops, either pre or post harvest. When applied to plants they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of the first protect plants by introducing them, or a microorganism capable of the first parts of the soil.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well

A phage or plasmid comprising radishin can be used for increasing resistance of paddy and rice blast disease against pathogenic microbes
                                                                                                                                                                                                                                                                                                                    Isolated DNA from Raphanus sativus used to transform a microbe and a plant to produce an antibacterial protein used to increase resistance rice paddy against pathogenic microbes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     124 AGTGGGACATGAGGAGTCTGTGGAAACAATAACGCATGCAAGAATCAGTGCATTAAC

                                                                                                                                                                                                                                                                                               The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TTCGAGGCACCAACAATGGTGGAAGCACAGAAGTTGTGCGAGAGGCCAAGTGGGAACATGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                     This cDNA represents the sequence of Rs-APP2 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to camino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 1239p product, which was further reamplified with the same primers and digoxigenin-11-durp instead of drTP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII CDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage vivo into the pBluescript phagemid form with the aid of helper phage vivo into the pBluescript phagemid form with the aid of helper phage their size compared by agarces gel electrophoresis. Four clones had inserts of approx. 400bp the others between 250-300bp. The inserts of approx. 400bp the others between 250-300bp. The inserts as Rs-AFPI (AAQ38650). Rs-AFP2 was seen to differ by only 2 amino acids from Rs-AFPI, so the Rs-AFPI cDNA was transformed to the Rs-AFP2 nucleotide sequence by PCR assisted site directed mutagenesis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0;

Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFP1 from R. sativus. The full-length CDNA sequence of PCR assisted atte-directed mutagenesis of Rs-AFP2 is given in AAQ70130 and the deduced amino acid sequence in AAR57327. (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is posttranslationally processed into the component protein molecules. The propeptide sequence is rich in amino acide A, V, S and T and contains diperbidic sequences consisting of either two acidic, two basic or one acidic and one basic residue as a cleavable linker sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antimicrobial protein; AMP1; transgenic plant; linker propeptide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence encodes the Arabidopsis PDF1.1 gene which is used in a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensing gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fungi and does not require cytotoxic or potentially harmful chemicals

This sequence encodes the Arabidopsis PDF1.2 gene which is used in a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensin gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fungi and does not require cytotoxic or potentially harmful chemicals
                                                                                    Sequence 400 BP; 109 A; 82 C; 80 G; 125 T; 0 U; 4 Other;

           This sequence represents the cDNA sequence encoding the antifungal polypeptide AlyAFP, from plants of the genus AlySeum. The sequence represents a composite of the sequences isolated by 5' and 3' RACE (Rapid Amplification of cDNA Ends) methods (see AAT94577 and AAT94580). The AMPAPP to 'ColyPeptide can be used to control phytopathogenic fungi, whilst the coding DNA can be used to produce transgenic plants that express the polypeptide making them resistant to the phytopathogenic fungi

XX
DR P-PSDB; AAY57565.
XX
An antibacterial protein gene of Wasabia japonica - useful as a food- or PT feed-additive.
XX
Claim 3; Page 13-14; 16pp; Japanese.
XX
CC The present sequence encodes an antibacterial protein isolated from CC Wasabia japonica. The antibacterial protein can be used as a food or feed CC additive. (Updated on 15-SEP-2003 to standardise OS field)
XX
Sequence 416 BP; 111 A; 77 C; 81 G; 147 T; 0 U; 0 Other;
